

DMR 5000

Inline Thickness Gauge for Quality Assurance
with Rhomboidal Technology

GreCon®

Production and Quality Control with the GreCon Thickness Gauge

Exploit all reserves of your production, homogenise your process, increase the availability of your equipment and increase your profit.

Fluctuations in panel thickness and deviations from nominal values reduce quality. Your customer will identify these as defects in your product.

The GreCon Thickness Gauge DMR 5000 provides accurate information to ensure a high quality standard by a quick adjustment of the production process.

All measured data can be transferred to an automatic process control or press control system. Thus, time periods required for product changes or production start-ups can be reduced and rejected material minimised with the DMR 5000.

ct-Frame

To achieve a continuous system availability, the DMR 5000 is equipped with a ct-frame. This basic construction of the measuring system makes an installation after saws or in continuous productions possible.

The system can be calibrated at any time by moving the ct-frames sideways out of the production line. Maintenance, diagnostics and repairs can be carried out during the running production.

Futhermore, the mobile construction of the system allows an escape run in case of big blisters and thus prevents the measuring system from being damaged.

ct-frame

Measuring Principle

There are two measuring principles to choose from, depending on the product structure, installation area and desired results. For solid materials and rough environments, the contact measuring DMR 500 is used. The laser measurement is primarily used for traversing measurements (DMLQ 5000) and soft materials (DML 5000). A consistent measuring accuracy of all systems is ensured by an automatic calibration system.

Contact Measurement

High-precision rollers contact the material and convert thickness variations into vertical motion within the transducer. The measurement is achieved by means of an optical element inside the transducer heads.

The measuring heads are installed in pairs, opposite each other, above and below the panel to ensure accurate measurements, even during bending or vertical movement of the panel.

To protect the measuring heads against mechanical damage, through blisters, for example, they are equipped with relatively big rollers. The top heads have special inclined inlet rails to avoid damage.

Contact measurement

Construction of the System

Up to 10 measuring tracks can be mounted on a frame, which is made out of patented aluminium profiles. The cable and compressed air ducts are integrated in the profile and thus protected against the surroundings.

Set-Point Positioning

The rhomboidal wing is a special mechanical protection and positioning system for contact measurement over the entire panel length. It allows panels to enter the measuring system at transport speeds of up to 200 m/min / 650 fpm with the heads in closed mode.

Furthermore, the measuring heads will stay in their positions after the last measurement, which reduces the mechanical strain of both the panel edges and the measuring heads. The consumption of compressed air is reduced. Even in case of a compressed air failure, the heads will stay in their last position.

Combination with other Measuring Systems

Since the thickness gauge is a modular system, it is possible to change the measuring requirements at any time. The system can be combined with the Ultrasonic Measuring System UPU 5000 and a Board Scale and thus provide a quality assurance station. This combination is primarily used after continuous presses.

Software

The visualisation software of all GreCon measuring systems is based on Windows. The software of the DMR 5000 consists of the following program modules:

- Recipe Management

This is a product data base in which different panel types and production parameters, which are relevant for the measuring system, can be stored.

Rhomboidal wing

■ Visualisation

The core of the software package is the visualisation software. It records, stores and graphically represents all measured data. The simple menu structure, which is identical for all GreCon measuring systems, makes an intuitive operation possible. Clear information and graphics enable the operator to quickly and effectively adjust the running production process. If a board scale is integrated, weight values and average raw densities will be visualised, as well as the thickness values.

■ SQL Data Base

This data base stores the measured values and provides a function to export them to other file formats for further processing and evaluation.

Network Connections

For the data transmission to higher-ranking process control systems, different network connections, such as OPC, are available.

Online After-Sales Service

GreCon measuring systems are equipped with a modem or VPN, which provides a direct connection to GreCon service when needed. Support, changes in parameters, software updates and trouble shooting are all possible online.

Technical Specifications

- Mains voltage: 230 V / 115 V
- Frequency: 50 Hz / 60 Hz
- Power consumption: 750 VA
- Compressed air supply: 6 bar / 90 psi
- Compressed air consumption: 0.7 l / 0.025 cf
per measuring track
- Max. number of heads
per electronics evaluation: 20 (10*)

* for 2-side measurement (pairs of measuring heads)

Measuring Accuracy per Measuring Track

- Standard:
Resolution: 0.01 mm
Repeating accuracy: < 0.01 mm**
- Option
Resolution: 0.001 mm
Repeating accuracy: < 0.001 mm**

Optionally, we offer a check of measuring means, in which the standard deviation as well as the accuracy of measured values are determined.

** standard deviation over 50 measurements

Applications

■ After the Press

In the wood based industry, thickness gauges are combined with GreCon Ultrasonic Cameras UPU 5000 and Board Scales to a quality assurance station. Data is recorded and evaluated by one central visualisation computer.

■ Sanding Line

A combination of up to three thickness gauges is used for final quality control in the sanding line. For example: a 1-track thickness gauge is installed before the calibration sander, a 2-track system after the calibration sander and a 3-, 5- or 7-track system after the finishing sander. Besides quality control, the measured data can be used to adjust the sanders to the current thickness values.

Why GreCon

- Quick and timely recognition of quality deviations
- Clear display of the consequences of changes in the production (intentional or unintentional)
- Display of optimisation potentials
- Reliable measured values
- Flexible use with various product alternatives
- Recording of measured values exactly to a millimetre
- Avoidance of rejects
- Low maintenance required
- Calibration, maintenance and service during the running production*
- High system availability*
- Data base for formulas, measuring data, calibration data, system settings*
- Wear and tear optimised due to pre-positioned measuring systems

Your Benefit

- No unacceptable material required to be added for sanding = reduction of production costs (0.1 mm ~ 0.8 % material)
- Production control within restricted tolerance limits
- Determines measured values to control the press
- Combination with board scales possible to determine the raw density
- ct-frame
- Quick product change
- Fast amortisation
